# Introducing TripMode 3 with a beautiful new design entirely optimised for macOS Big Sur

**The new version is the biggest update ever for TripMode, with powerful data usage controls, deeper privacy insights and historical data usage reports.**

Geneva, Switzerland — Alix today introduced TripMode 3, the latest version of the world's leading data saver on macOS. More than 3 years in the making, TripMode 3 introduces a beautiful redesign that is entirely new yet instantly familiar and easy to use.

For the first time, TripMode 3 includes enhanced capabilities that reach beyond the data saving use cases and bandwidth optimisation, offering Mac users more control and oversight over their online activity and privacy.

- The new *Live Monitor* allows TripMode 3 users to oversee the traffic of all apps in real time, making it easy to identify excessive or unexpected data transfers. The TripMode 3 window can be detached from the menu bar and moved around, it is the perfect companion in day-to-day use.
- The all-new *app inspector* adds a privacy insights, by revealing any data transfer activity from or to 3rd party servers, helping users block apps that interact with suspicious domains.
- *Historical reports*, available when TripMode is turned off, allows users to instantly check how much data was used in total and per app in the past.
- Advanced users can now also *allow all newly detected apps to access the Internet*, making TripMode 3 much more flexible for users who just need to block a few apps, and allow all the rest.
- TripMode 3 is fully taking advantage of the speed, efficiency and design of Apple's newest Big Sur capabilities, including Network Extensions, SwiftUI, and a revised design, powering TripMode's popular *Profiles*, *Traffic limits*, *Scheduler*, *Hotspot auto-detection*, and more.

David Dudok de Wit, TripMode Product Manager and Co-Founder:

*"It has never been easier to benefit from TripMode in everyday situations: as a data saver when traveling, as a bandwidth optimiser when doing online calls, as a distractions blocker when working, or simply as a discreet companion that keeps an eye out for unusual online activity."*
